

The slide features a light purple background. In the top right corner is a blue React Native atom logo. Below it, the text "The React Native Development Process" is centered in a black sans-serif font.

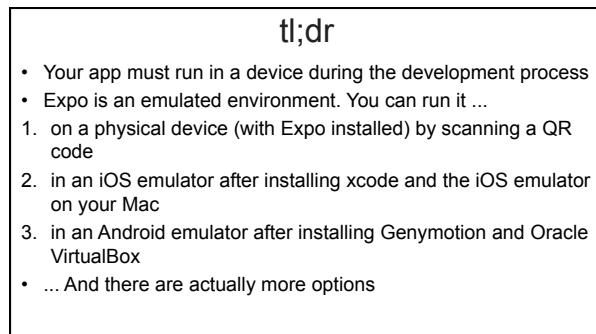

---

---

---

---

---

A light purple rectangular box containing the text "tl;dr" in a bold, black, sans-serif font. Below this, a bulleted list details various ways to run a React Native app:

- Your app must run in a device during the development process
- Expo is an emulated environment. You can run it ...
  1. on a physical device (with Expo installed) by scanning a QR code
  2. in an iOS emulator after installing xcode and the iOS emulator on your Mac
  3. in an Android emulator after installing Genymotion and Oracle VirtualBox
- ... And there are actually more options

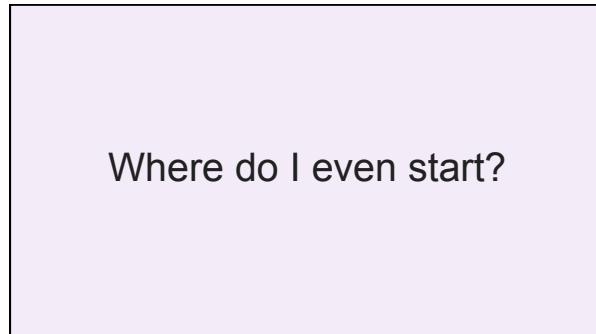

---

---

---

---

---

A light purple rectangular box containing the text "Where do I even start?" in a large, bold, black, sans-serif font.

---

---

---

---

---

## Three ways to start a RN project

1. Manually
2. react-native cli
3. expo

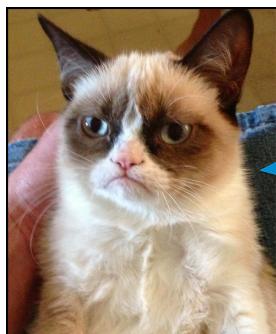

---

---

---

---

---

Manually

Really?!?  
We're  
considering  
this? Wow.

---

---

---

---

---

## react-native-cli

- react-native init
- Creates an initial project
- You then code and deploy to a real device or run in an emulator

---

---

---

---

---

## create-react-native-app

- A command-line tool that scaffolds a basic project.
- \$ npx create-react-native-app cool-app
- \$ cd cool-app
- \$ expo start

---

---

---

---

---

---

---

## What is react-native-cli?

- It's older.
- Allows you to init an app but it must be developed in Android Studio and in Xcode. JDK, Android SDK, Need Android 6+ (Marshmallow)
- Need npm version 4, not 5. Can't use the latest version of npm
- Windows to Android - Yes
- Windows to iOS - No
- MacOS to Android - Yes
- MacOS to iOS - Yes
- Linux to Android - Yes
- Linux to iOS - No

---

---

---

---

---

---

---

---

## Which to use?

react-native init vs. expo	rni	expo
Can use native modules written in Java/Swift	✓	✗
Can code without Android Studio and XCode	✗	✓
Can develop for iOS on Windows	✗	✓
Can test without being tethered to a device via USB	✗	✓
JavaScript APIs provided/no extra installs needed	✗	✓
Setup and configuration time in minutes vs. hours	✗	✓
Easy to share the app during development	✗	✓
Officially recommended by the react-native team	✗	✓

---

---

---

---

---

---

---

---

```
$ npx create-react-native-app cool-app
npx: installed 28 in 2.652s
? Choose a template: blank
[14:27:05] Downloading project files...
[14:27:09] Extracting project files...
[14:27:16] Customizing project...

Your project is ready at /Users/you/coolApp
To get started, you can type:

  cd cool-app
  expo start

$
```

---

---

---

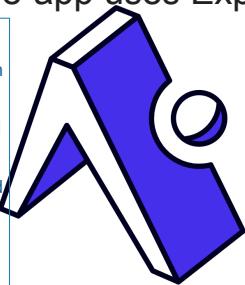

---

---

---

## create-react-native-app uses Expo

Expo apps are React Native apps which contain the Expo SDK. The SDK is a native-and-JS library which provides access to the device's system functionality (things like the camera, contacts, local storage, and other hardware). That means you don't need to use Xcode or Android Studio, or write any native code, and it also makes your pure-JS project very portable because it can run in any native environment containing the Expo SDK

---

---

---

---

---

---

How do I run it?

---

---

---

---

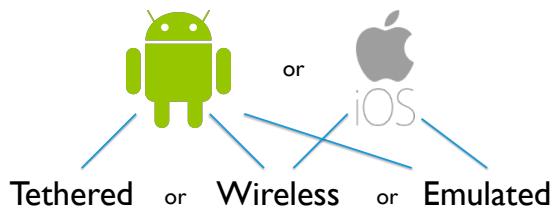

---

---

## expo start

- Builds and bundles your application into memory
  - This starts a node server which serves a static json config at a given URL.
  - If the expo client browses to that config file, your app will run
- ```
{
  "sdkVersion": "27.0.0",
  "name": "cool-app",
  "version": "0.1.0",
  "xde": true,
  "developer": {
    "tool": "cra",
    "projectRoot": "./coolApp"
  },
  "packagerOpts": {
    "hostType": "tunnel",
    "lanType": "ip",
    "dev": true,
    "minify": false,
    "urlRandomness": null
  },
  "env": {},
  "bundleUrl": "http://
172.16.2.232:19001/",
  "debuggerHost": "172.16.2.232:19001",
  "mainModuleName": "./node_modules/...",
  "logUrl": "http://172.16.2.232:19000/logs",
  "id": "@anonymous/xn-..."
}
```

But Expo can't run in a browser. It needs a device like ...

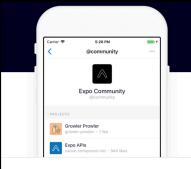

## So we have these options

- q Show a QR code that you scan with your physical device's camera
- a Run in an Android emulator or tethered device
  - i Open an iOS emulator and run it in there

```
$ expo start
> coolapp@0.1.0 start /Users/rap/Desktop/coolApp
> react-native-scripts start
16:14:20 Starting packager...
Packager started!
Your app is now running at URL: expo://192.168.1.16:19000
View your app with live reloading!
Android devices:
  -> Point the Expo app to the QR code above.
    (You'll find the QR scanner on the Projects tab of the app.)
  iOS devices:
  -> Open a browser & to email/text the app URL to your phone.
  Emulators:
  -> Press a (Android) or i (iOS) to start an emulator.
Your phone will need to be on the same local network as this computer.
For links to install the Expo app, please visit https://expo.io.
Logs from serving your app will appear here. Press Ctrl+C at any time to
stop.
  -> Press a to open Android device or emulator, or i to open iOS emulator
  -> Press a to display QR code
  -> Press d to start packager, or R to restart packager and clear cache
  -> Press d to toggle development mode. (current mode: development)
```

## 1. Run it on your non-tethered device

The "q" option

**Install the Expo client app on the device on which you want to test**

- <http://expo.io>
- Apple App Store
- Google Play Store

Run your projects before you deploy. Open projects by scanning QR codes. If you need to, Download IPA 2.8.1 or Download APK 2.8.0.

[Star](#)

[iOS App](#)   [Android App](#)

- Displays QR Code that you can scan on your connected device that has the expo app installed.
- Thus the device/emulator must be on the same network as the server (aka. your development machine)

---

---

---

---

---

---

## 2. Run it in an iOS Emulator

The "i" option

---

---

---

---

---

---

To use the iOS simulator you must ...

- Be on a Mac
- Have xcode installed and configured
- Have iOS simulator installed and configured

---

---

---

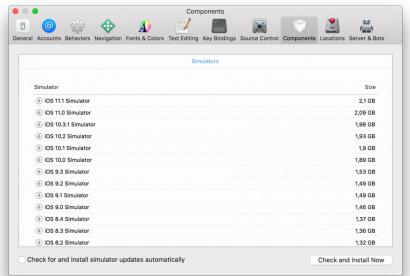

---

---

---

## To install the iOS simulator ...

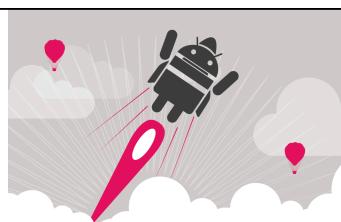

- Open Xcode
- Go preferences - components - simulators - Pick one.

## 3. Run it in an Android emulator

The "a" option

The official  
Android  
emulator is  
Genymotion

Install the free, personal version at  
<http://Genymotion.com/fun-zone>

Register with a real email address

[Continue](#)

- Click on the little link at the bottom

Enjoy

TRY FOR 30 DAYS OR BUY GENYMOTION

[Download Genymotion for personal use](#)

---

---

---

---

---

---

## Genymotion needs VirtualBox

- Go to [virtualBox.org](https://www.virtualbox.org) and hit the comically large download button
- Your OS may block the install for security violations but when you put an exception on it, it installs okay.

VirtualBox

About Help

Your virtual devices

Samsung Galaxy S8 - 8D - API 26 - 1440x2960  
Custom Phone - 8D - API 26 - 768x1280

User: bob@creator.net

---

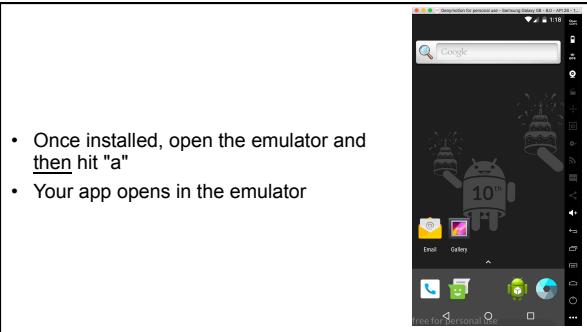

---

---

---

---

---

- Once installed, open the emulator and then hit "a"
- Your app opens in the emulator

---

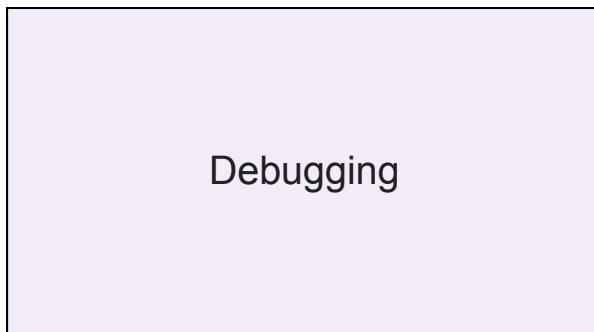

---

---

---

---

---

---

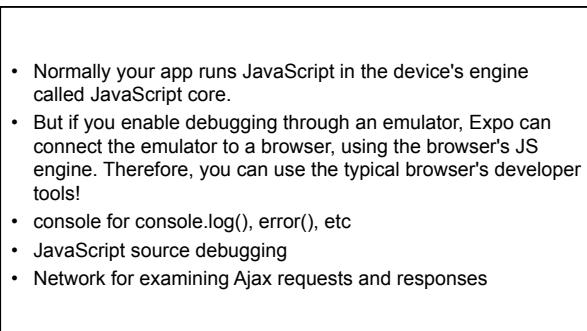

---

---

---

---

---

- Normally your app runs JavaScript in the device's engine called JavaScript core.
- But if you enable debugging through an emulator, Expo can connect the emulator to a browser, using the browser's JS engine. Therefore, you can use the typical browser's developer tools!
- console for console.log(), error(), etc
- JavaScript source debugging
- Network for examining Ajax requests and responses

---

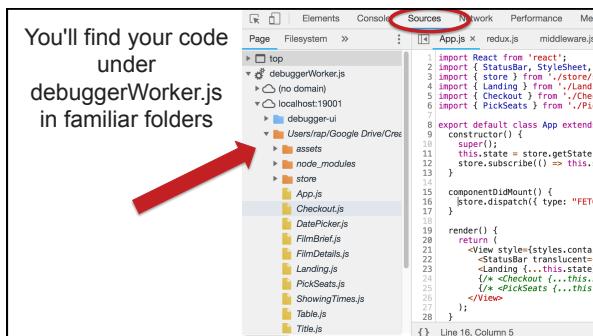

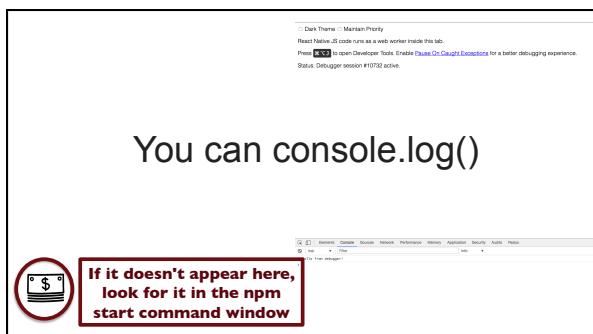

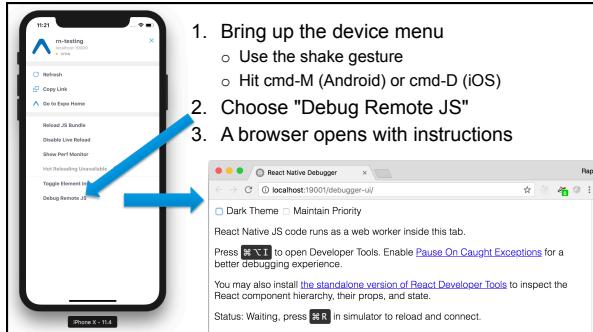

---

---

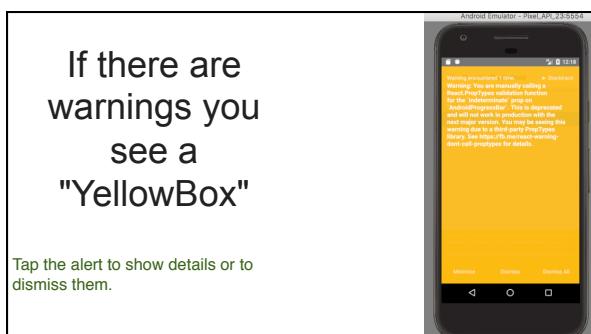

---

---

---

A screenshot of the React Native Debugger interface. The title bar says "You can set breakpoints". Below it is a toolbar with icons for file operations like Open, Save, and Close, followed by tabs for Elements, Console, Sources, Network, Performance, Memory, and a "more" dropdown. Under the Sources tab, there's a list of files: debuggerWorker.js, index.ios.bundle...e&minify=false, and index.js (which is currently selected). A tooltip message "Serving from the file system? Add your files into the workspace." is displayed above the code area. The code itself is a snippet of JavaScript with a blue highlight under the line "11 console.log('onPress has been called!');". The line numbers 7 through 17 are visible on the left, and the word "Line" is at the bottom left.

- This can be dismissed.
- It can be started with `console.error()`;

If there are errors, you see a "RedBox"

Invariant Violation: Element type is invalid: expected a string (for built-in components) or a class/function (for composite components) but got: object. You likely forgot to export your component from the file it's defined in, or you might have mixed up default and named imports.

Check the render method of 'CellRenderer'.
